DIY Solar Installation quality and cost savings explained

Quality Aspect:

Australian solar market is rapidly growing; with the increased opportunities thousands of small scale solar companies enter the market every year. However, most of them start struggling within first 3 years of their operation when they encounter increased number of customer complaints of product malfunctioning which is often a problem when cheap products are installed by a cheap solar installer to cut down the labor cost, these installers often accompany young roofers who are inexperienced and have incomplete or zero knowledge of installing rooftop solar. Thus, don't be surprised if your roof starts leaking within couple of years after solar installation. Incorrect installation may save some upfront cost for a solar company; however, they turn out to be nightmare when manufacturers reject product warranty due to incorrect solar installation.

These challenges often make it impossible for the solar companies to survive and they go under liquidation within first 5 years leaving thousands of customers behind with cheap and unwarranted products lying on their roof and even leaking roof in worst case scenarios.

Over 700 solar companies have vanished from Australian solar market alone in the past 8 years.

Scary isn't it?

DIY solar is not only about saving thousands of dollars but also ensuring quality solar installation by taking power on your own hand.

Only DIY solar gives you an opportunity to select your choice of qualified and experienced solar installer, now you have a chance to install your solar risk free by selecting a well qualified and experienced installer of your choice and not relying on cost saving solar companies who often selects a cheap installer to maximize their profit.

Cost Saving Aspect:

You not only have the power of select the products, warehouses and installers of your choice but also have the power to save thousands of \$\$\$\$ from your pocket. Did you know a quality solar system of 6.6 kW size will cost you more than eight thousand dollars when you choose to get it done from a professional solar company? Whereas you can get the same solar system under three thousand dollars when you choose to do it yourself. Isn't it a big deal? Saving more than five thousand of dollars and also ensuring quality solar installation.

Professional solar companies often charges high commissions not only on products but also on solar installation, freight and to keep up with their logistic costs. The list doesn't end here; it goes on for years when you ask for support and services. This trap is a never ending story.

Choose not to fall in this trap and start building your quality solar by clicking here ([Form link](#)).
